

## A work horse with all the features...

The Directors of the Italian manufacturer M&B Engineering have been designing and building wheel balancers since the '70's.

The M&B WB680 wheel balancer comes from a very long and distinguished line of wheel balancers. Its the end result of continuous improvement and fine tuning. When you get good at something you stick to it. The WB680 is a great example. It features all the things that a high volume tyre store or dealership needs but its price isn't burdened with sales features and hyped up add ons which most operators just won't use. It is however, a very sturdy and accurate wheel balancer made for all day, every day use. One of its greatest benefits is its ease of use and lack of training required.

It features:

- Made in Italy from Italian components.

- Automatic wheel selection - no need to touch any buttons to go from alloy wheel to steel.
- A spotting laser (not a line laser) to point to where the alloy stick on weight needs to be positioned.
- Automatic wheel positioning.
- Heavy duty 1.1 KW motor.
- LED array to illuminate the inside of the wheel.
- Hide behind the spoke program.
- Diagnostics are available as an option.
- After sales support in each State and Territory.
